Digital holographic microscopy is digital holography applied to microscopy. Digital holographic microscopy distinguishes itself from other microscopy methods by not recording the projected image of the object. Instead, the light wave front information originating from the object is digitally recorded as a hologram, from which a computer calculates the object image by using a numerical reconstruction algorithm. The image forming lens in traditional microscopy is thus replaced by a ...

Microscopy is the technical field of using microscopes to view objects and areas of objects that cannot be seen with the naked eye (objects that are not within the resolution range of the normal eye). There are three well-known branches of microscopy: optical, electron, and scanning probe microscopy, along with the emerging field of X-ray microscopy.

Holographic Microscopy, Holographic microscopy is the most common form of quantitative phase imaging. The HoloMonitor ® live cell imaging microscope employs digital holographic microscopy to allow non-invasive visualization and quantification of living cells without compromising cell integrity. Conventional Holography. A traditional hologram is recorded on a photographic plate.
